WORKING PAPERS

Why Do Firms Borrow from Foreign Banks? (Job Market Paper)

I examine U.S. firms' motives for participating in cross-border syndicated loans with foreign banks. Firms borrowing from foreign lead arrangers pay higher interest rates on their loans compared to firms borrowing from local banks, controlling for firm and loan characteristics and using matched sample analyses. These firms experience an increase in foreign income and international M&A activity after the loan, which suggests that global expansion of operations is an important reason why a firm borrows beyond borders. I also find that loan spreads increase with the geographic and cultural distance between borrowers and foreign lenders, consistent with higher information acquisition and monitoring costs.

Foreign Acquisition and Credit Risk: Evidence from the U.S. CDS Market

This paper empirically analyses the effect of foreign block acquisitions on the U.S. target firms' credit risk as captured by their CDS. The involvement of foreign investors triggers a major increase, about 42 basis points, in the target firm's CDS. This effect is mostly pronounced for firms with majority control transactions, with acquirers from developed markets, and for diversifying deals. The findings are consistent with an asymmetric information hypothesis. Indeed, foreign block purchases are significantly associated with an increase in the target exposure to idiosyncratic stock volatility.

Does Corporate Governance Matter? Evidence from the AGR Governance Rating (with Alberto Plazzi and Walter Torous)

Poor corporate governance facilitates unreliable financial reporting. The AGR governance rating is based on the premise that a more accurate assessment of corporate governance can be formulated by taking this output of corporate governance into account. We document that time series variation in a firm's AGR rating reliably forecasts measures of firm operating performance. A long/short strategy based on the AGR rating generates a risk-adjusted return of approximately 5% per year but, consistent with learning by the market, this abnormal performance has been declining over time. Most this return differential originates with firms having poor corporate governance.
